

Pin location correction

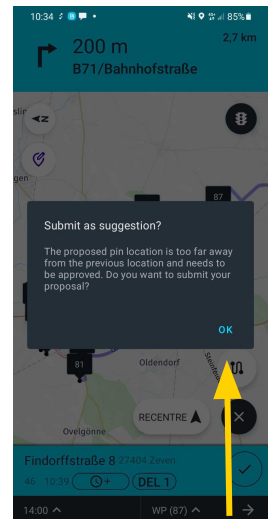

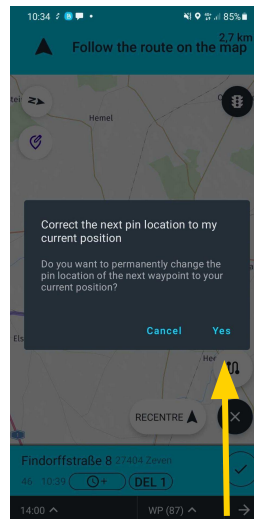

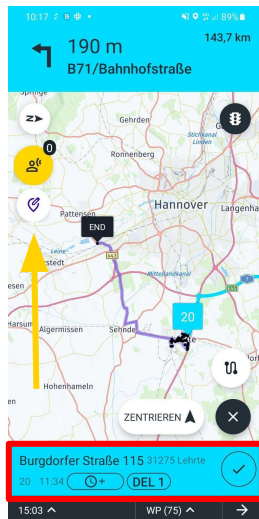

The entrance is around the corner, the industrial complex has multiple entrances or the pin is located on the wrong building? You know better which door is the right one - therefore you want to be navigated there next time right away.

You can do this in 2 places in the App:

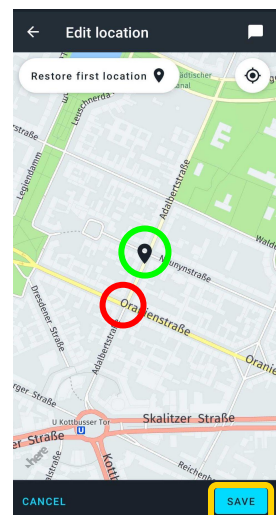

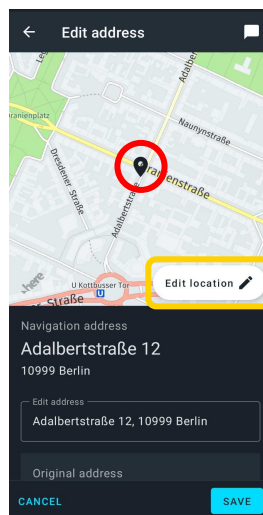

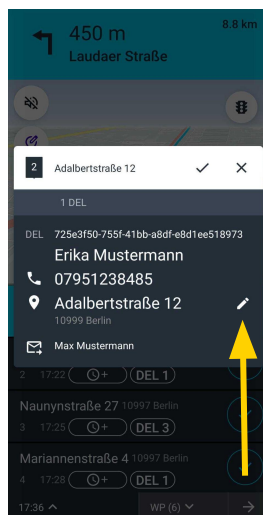

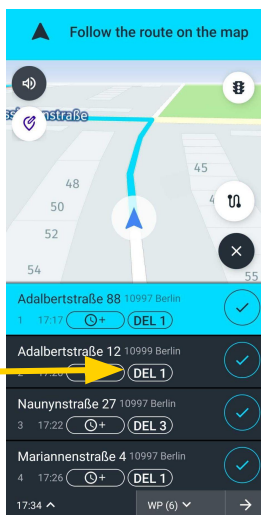

- **While in the navigation:** Change the next upcoming waypoint location to your current location - done in 1-click - with immediate effect and without further support required.

The address on the parcel and the address in the App should match. If not, please **edit the address** first.

The to be corrected pin is on the **current next OPEN waypoint (light blue)**. Make sure it was not already automatically closed.

- **Anywhere, anytime: Correct pin location on the map**
You are already at your next waypoint or you notice the wrong location in the morning at the depot? You can also **change the location of any waypoint**, at any location and at any time during your current tour. This can easily be done by entering the “Edit address” screen and **dropping the pin on the correct location**.

The new pin location is applied for that day in both cases. To be saved for the future we check your input. If your proposal has a similar address or is close to the previous location, it is auto-approved. If it is not auto-approved and far away, it is auto-rejected. Everything in between will be manually checked in order to make a decision, which may take a bit longer.
